Assignment 1

Internet Explorer – Client-Server Architecture & Website Working

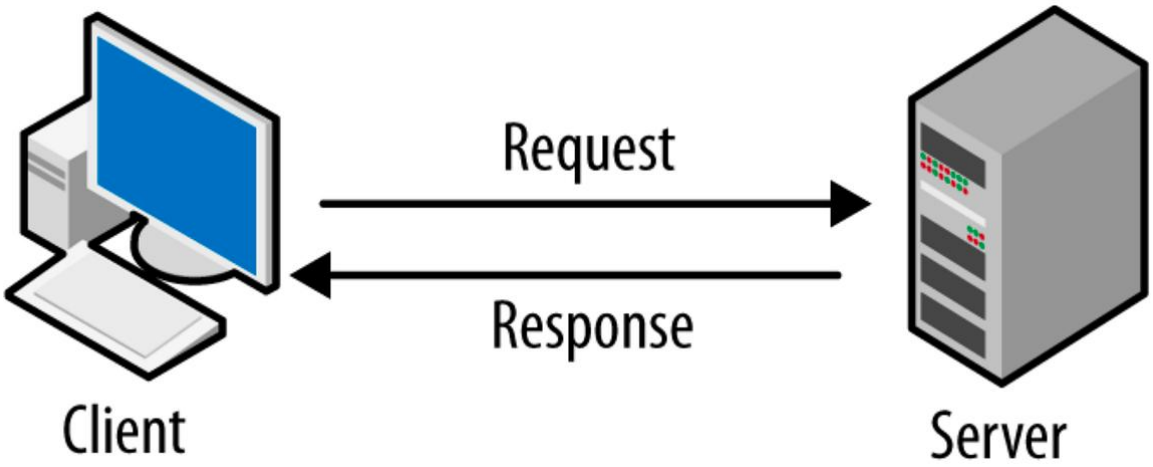
1️⃣ Client-Server Architecture

Client-server architecture is a model where:

- **Client** → User's device (browser like Chrome, Edge, Firefox)
- **Server** → Computer that stores website files and sends them to client

Flow:

1. User enters website URL in browser
2. Browser sends request to server through internet
3. Server processes request and sends webpage files (HTML, CSS, JS)
4. Browser displays the webpage to the user



2️⃣ What happens when you open a website?

Step-by-step working:

1. User types URL (example: www.google.com)
2. Browser checks **DNS** to find IP address of server
3. Request sent to server using **HTTP/HTTPS**
4. Server processes request and sends:

    - HTML → Structure
    - CSS → Design
    - JavaScript → Functionality
5. Browser renders webpage on screen
6. User can now interact with website

User → Browser → Internet → Server → Response → Browser → Display Page
